

Remaining launch checklist

Only the work still required to make the Academy app production-ready

DEFINITION OF DONE

The finish line

Every current Academy member can request a Magic Link, reach the content they already own, use the community and field tools, and reopen saved work on another device. The desktop web app, mobile web/PWA, and signed iOS and Android builds all pass their production paths.

BACKEND LIVE

Eleven migrations, 50 RLS-protected public tables, six Edge Functions, and the health endpoint are active in Supabase.

ARCHIVE VERIFIED

60 login members, 49 enrollments, 109 published lessons, 19 drafts, community data, and assets reconcile to GHL.

APP VERIFIED

Desktop, mobile, and tablet layouts pass responsive QA. Tests, PWA, Android release bundle, and iOS Release simulator checks

RELEASE OPEN

GitHub PR #2 contains the complete release tree. Netlify preview, merge, and production proof still remain.

Completed and removed from this checklist

- ☒ Supabase migrations, RLS audit, security-function hardening, and Edge Function deployment are complete.
- ☒ GHL course, lesson, member, enrollment, community, event, and asset capture is complete and exact-count verified.
- ☒ Google Play developer identity, website, and phone verification are complete.
- ☒ The Apple Developer renewal card is added. The simulator build is complete.
- ☒ Desktop web workspace, mobile/PWA layout, calculator, Magic Link UI, native wrappers, importer, billing logic, and release tests are built.

Six remaining gates

1. Email and owner identity. 2. Academy import and member access. 3. Stripe test proof. 4. GitHub and Netlify production release. 5. Real-device AR and signed store builds. 6. Controlled GHL cutover.

NOT DONE UNTIL

Keep HighLevel live until member login, content access, production smoke tests, real-device measurement, and rollback evidence all pass.

Email and production identity

Verify the sender, set exact URLs, and create the two accounts needed for migration proof

STEP 1

Verify the Resend sender

OWNER: Dirty Turf owner

- ☒ Resend sending domain updates.dirtyturf.com is created and its DKIM/SPF records are ready.
- ☐ Sign in to the Cloudflare account that owns dirtyturf.com. The current Cloudflare login has no domains. Publish every Resend TXT/CNAME record as DNS-only.
- ☐ Wait for Resend to show the domain as verified. Send one authenticated test email from a Dirty Turf address to a separate inbox and confirm it reaches the inbox, not spam.
- ☐ Configure Supabase Auth custom SMTP with Resend. Use the verified Dirty Turf sender, not onboarding@resend.dev.
- ☐ Send a Supabase Magic Link to the owner and test member. Confirm both cold-start web redirect and com.dirtyturf.academy://auth/callback on a phone.
- ☐ Rotate the Resend API key pasted in chat after SMTP works. Save the replacement only in Resend/Supabase account settings, never in Git, Netlify public variables, or app code.

STEP 2

Lock production identity

OWNER: Release owner

- ☐ Confirm the exact production HTTPS domain. Set it as the Supabase Site URL, Netlify custom domain, APP_URL, allowed origin, and auth redirect.
- ☐ Keep the native callback in Supabase redirect allowlists and Edge Function AUTH_REDIRECT_URLS.
- ☐ Create one permanent Dirty Turf owner in Supabase Auth and one normal test member. Confirm the auth trigger creates the owner profile, organization, and owner membership.
- ☐ Record the owner organization UUID; this is the only missing value required by the private Academy import manifest.
- ☐ Confirm privacy, support, and account-deletion pages use the final production domain and are publicly reachable.
- ☐ Record a client owner and recovery owner with MFA for Supabase, Resend, GitHub, Netlify, Stripe, Apple, Google Play, GHL, and DNS.

Secret boundary

BROWSER-SAFE: VITE_SUPABASE_URL, publishable key, public Payment Link
SERVER-ONLY: service-role key, GHL token, Resend key, Stripe secret + webhook secret

NOT DONE UNTIL

Do not invite members until a real Supabase Magic Link delivers from the verified Dirty Turf sender and both web and native redirects work.

Import and guarantee member access

Load the verified archive, provision every account silently, then pilot Magic Links

STEP 3

Dry run and import

OWNER: Migration owner

- ☐ Add the production owner organization UUID to output/private/dirty-turf-academy-import.json. Keep the file ignored and client-owned.
- ☐ Run `npm run academy:access-audit`. Require 60 unique login emails, 49 enrolled members, zero duplicates, and `allEnrolledCanLogin:true`.
- ☐ Call `academy-import` with `commit:false`. Match every count to the verified archive before allowing writes.
- ☐ Call `academy-import` with `commit:true` once, then repeat it and prove provider IDs make the import idempotent.
- ☐ Open representative lessons, drafts, quizzes, posts, comments, events, member profiles, assets, and enrollment states in both GHL and the app.
- ☐ Confirm the normal test member cannot run an import, read another company, or fetch a private Academy asset without authorization.

STEP 4

Provision all member accounts

OWNER: Access owner

- ☐ Run the invite/provision preview. Require all 60 current login-eligible members ready and all 49 enrollments linked.
- ☐ Provision all 60 accounts without sending mail. Preserve imported access grants; passwords do not migrate.
- ☐ Prove an imported member can request a Magic Link and an unknown email cannot create Academy access.
- ☐ Pilot Magic Links with 3-5 members across iPhone, Android, and web. Check delivery, cold start, expiration, reuse, logout, and second-device login.
- ☐ After the pilot passes, notify the remaining members in batches of no more than 25 and monitor delivery failures.
- ☐ Confirm owner, admin, moderator, active, cancelled, suspended, and unassigned access behavior before broad notification.

Exact sequence

```
owner org UUID -> access audit -> import dry run -> commit -> repeat
preview accounts -> provision silently -> 3-5 pilot links -> batches <= 25
```

NOT DONE UNTIL

Do not send all 60 links at once. A silent account import plus a small delivery pilot protects members from lockouts and duplicate invitations.

Payments and production web

Prove billing in Stripe test mode, then merge and verify the deployed release

STEP 5

Activate Stripe test mode

OWNER: Billing owner

- ☐ Create or confirm the client-owned Stripe account, business verification, Dirty Turf administrators, MFA, billing, and recovery ownership.
- ☐ Create the Academy product and Price in test mode. Map the Price to an inactive Academy plan and its included courses, then activate it.
- ☐ Register the Supabase stripe-webhook endpoint for Checkout and subscription lifecycle events. Store secret and webhook signing keys only in Supabase secrets.
- ☐ Configure Customer Portal and a web Payment Link. Add only the public Payment Link to Netlify.
- ☐ Complete one existing-member Checkout and one new-email Payment Link purchase. Verify account, grant, enrollment, billing rows, and Magic Link access.
- ☐ Replay a webhook, force a retrievable failure, and prove idempotent recovery. Then cancel both a Stripe-only member and an imported GHM member to prove grant precedence.
- ☐ Confirm Billing Portal works on web and native iOS/Android show no purchase button or external checkout link.

STEP 6

Merge and prove production

OWNER: Release owner

- ☐ Wait for GitHub PR #2 checks and the Netlify preview. Review the complete diff and run a secret scan before merge.
- ☐ Set the exact production domain, Supabase public variables, and public Stripe Payment Link in Netlify. Keep every secret server-side.
- ☐ Verify preview auth, deep links, calculator, Academy, lessons, community, events, assets, progress, PWA, headers, desktop/mobile widths, and console/network logs.
- ☐ Merge PR #2 to main, wait for Netlify production, and repeat the authenticated golden path on the deployed URL.
- ☐ Record commit SHA, deploy ID, migration/function versions, smoke-test account, rollback owner, and rollback steps.

NOT DONE UNTIL

Stripe stays in test mode and the old production site stays untouched until PR checks, preview QA, billing proof, and authenticated production smoke all pass.

Real phones and store builds

A simulator proves compilation; launch approval requires physical-device accuracy and signed releases

STEP 7

Run the measured-yard test

OWNER: Field QA owner

- ☐ On a supported iPhone, place at least four live AR points around a tape-measured yard, undo one point, finish, and record area, perimeter, device, OS, and error percentage.
- ☐ Repeat on a supported Samsung/Android phone with ARCore. Compare both results to the same tape-measured reference.
- ☐ Trace the same yard on the map, test multiple turf polygons, and compare combined area to the known reference.
- ☐ Test camera/location denial, unsupported hardware, tracking loss, rotation, background/resume, poor network, offline behavior, and duplicate-save protection.
- ☐ Save a calculation with photos and reopen it on a second device. Verify area, rate, pounds, 40-lb and 50-lb bags, price, method, date, and history.

STEP 8

Create signed test releases

OWNER: Store owner

- ☐ Apple: the Free Apps Agreement is active. Complete EU trader compliance, confirm seller/team signing, create the App Store Connect record, archive Release, and upload to TestFlight. Paid Apps terms are not a blocker unless in-app purchases are added.
- ☐ Google Play: create the app record, confirm package/version/signing ownership, build a signed AAB, and publish to Internal testing.
- ☐ Add store name, description, category, screenshots, privacy policy, support URL, deletion URL, reviewer login, data-safety/privacy answers, and content rating.
- ☐ Test install, update, deep link, Magic Link, logout, expired/reused links, camera, location, photos, map, lessons, community, and notifications on store builds.
- ☐ Confirm both store builds are consumption-only and give reviewers a pre-existing Academy test account.

NOT DONE UNTIL

Do not submit for review until AR accuracy is recorded on both platforms and TestFlight plus Play Internal builds complete the full signed-in golden path.

Cutover, monitor, and sign off

Keep the launch reversible until Dirty Turf approves member access and production behavior

STEP 9

Run the final GHL delta

OWNER: Migration owner

- ☐ Freeze GHL course/community changes, take a final delta capture, validate it, and reconcile member, enrollment, lesson, post, comment, and event counts.
- ☐ Run a final import dry run, commit the approved delta once, and repeat it to prove idempotency.
- ☐ Back up the private archive and production database. Record the restore owner and test the documented rollback path.
- ☐ Rotate the GHL private token shared in chat and keep the replacement server-side only.
- ☐ Keep GHL read-only as the rollback source until member access, content, billing, web production, and store pilot acceptance are signed off.

STEP 10

Pilot, launch, and monitor

OWNER: Product owner

- ☐ Complete the 3-5 member pilot before the broad member notification. Resolve every login, entitlement, or content mismatch first.
- ☐ Monitor auth delivery, invite failures, Edge Function errors, webhook failures, database errors, app crashes, and support during the first 24 hours.
- ☐ Record an owner, timestamp, and evidence link for each final sign-off below.

Final sign-off

60 accounts ready / 49 enrollments linked	OWNER / TIME / RESULT
Stripe test purchase, replay, cancellation	OWNER / TIME / RESULT
Netlify production golden path	OWNER / TIME / RESULT
iPhone AR / Samsung AR / map accuracy	OWNER / TIME / RESULT
TestFlight / Play Internal acceptance	OWNER / TIME / RESULT
GHG delta, backup, and rollback	OWNER / TIME / RESULT

Simple next actions

1. Verify Resend DNS. 2. Create owner and test member. 3. Import and provision. 4. Prove Stripe. 5. Merge and smoke production. 6. Test real phones. 7. Upload signed builds. 8. Pilot members. 9. Cut over.

NOT DONE UNTIL

Launch only after every sign-off passes. Until then, keep HighLevel available and label the new app as a controlled pilot.
